## 1.1 Concentration Inequalities

**Theorem 1.1** (Markov's Inequality). Let  $x$  be a non-negative random variable. Then for  $a > 0$ ,

$$\mathbb{P}(x \geq a) \leq \frac{\mathbb{E}[x]}{a}$$

**Theorem 1.2** (Chebyshev's Inequality). Let  $x$  be a random variable. Then for  $c > 0$ ,

$$\mathbb{P}(|x - \mathbb{E}[x]| \geq c) \leq \frac{\text{Var}[x]}{c^2}$$

**Theorem 1.3** (Law of Large Numbers). Let  $x_1, x_2, \dots, x_n$  be  $n$  independent samples of a random variable  $x$ . Then

$$\mathbb{P}\left[\left|\frac{x_1 + x_2 + \dots + x_n}{n} - \mathbb{E}[x]\right| \geq \epsilon\right] \leq \frac{\text{Var}[x]}{n\epsilon^2}$$

**Theorem 1.4** (Master Tail Bounds Theorem). Let  $x = x_1 + x_2 + \dots + x_n$ , where  $x_1, x_2, \dots, x_n$  are mutually independent random variables with zero mean and variance at most  $\sigma^2$ . Let  $0 \leq a \leq \sqrt{2n\sigma^2}$ . Assume that  $|\mathbb{E}[x_i^s]| \leq \sigma^2 s!$  for  $s = 3, 4, \dots, \lfloor (a^2/4n\sigma^2) \rfloor$ . Then,

$$\mathbb{P}[|x| \geq a] \leq 3e^{-a^2/(12n\sigma^2)}$$

**Theorem 1.5** (General Master Tail Bounds Theorem). Let  $x = x_1 + x_2 + \dots + x_n$ , where  $x_1, x_2, \dots, x_n$  are mutually independent random variables with zero mean and variance at most  $\sigma^2$ . Let  $0 \leq a \leq \sqrt{2n\sigma^2}$  and  $s \leq n\sigma^2/2$  is a positive even integer and  $|\mathbb{E}[x_i^r]| \leq \sigma^2 r!$  for  $r = 3, 4, \dots, s$ . Then,

$$\mathbb{P}[|x_1 + x_2 + \dots + x_n| \geq a] \leq \left(\frac{2sn\sigma^2}{a^2}\right)^{s/2}$$

If further,  $s \geq a^2/(4n\sigma^2)$ , then we also have:

$$\mathbb{P}[|x_1 + x_2 + \dots + x_n| \geq a] \leq 3e^{-a^2/(12n\sigma^2)}$$

**Theorem 1.6** (Chernoff Bound). Let  $x$  be a Bernoulli random variable, with  $\mathbb{E}[x] = p$  and  $\text{Var}[x] = p(1-p)$  then we have that

$$\mathbb{P}\left[\left|\frac{y}{n} - p\right| \geq \sqrt{2cp(1-p)}\right] \leq 3e^{-np(1-p)c^2/6}$$
